

New Features

## Your Complete Internet Filtering and Monitoring Solution

DynaComm i:filter manages, monitors, and secures Internet traffic in a client-server environment that melds seamlessly with your network architecture and user organization to improve employee productivity, preserve network resources, and decrease exposure to legal liability.

### Complete Control of Internet Use

Control employee Internet access immediately upon installation. Manage access with rules to block access to sites grouped by category, or with a white list of approved sites.

### Custom Usage Policies

Build Internet-use policies based on Web site, user, time of day, file type, protocol, and more, to give you total control over who and how your Internet resource is used. Block, allow, or simply monitor access with one or more rules in a single policy, and enforce multiple policies for flexible filtering.

### Flexible Architecture & Scalability

Install all components on one system, or install individual components on separate systems. Quickly add, or remove, components to maximize network resources and eliminate bottlenecks.

### Processing Choice

Choose a Network monitor for efficient parallel processing of Internet requests, or choose an ISA Server monitor for pre-processing of Internet requests before they are sent out on your network.

### Immediate Alerts

Set up automatic e-mail alerts for instant notification of requests for blocked or restricted sites and files. Unauthorized downloads of forbidden files, such as music, videos or file transfer packages, is immediately made known to one or more e-mail recipients.

### Browse Days & Time

Retain complete control of when individual users or groups of users access the Internet or specific sites by day of the week, time of day, or length of browse time, or with use of override access.

### Conserve Network Resource Usage

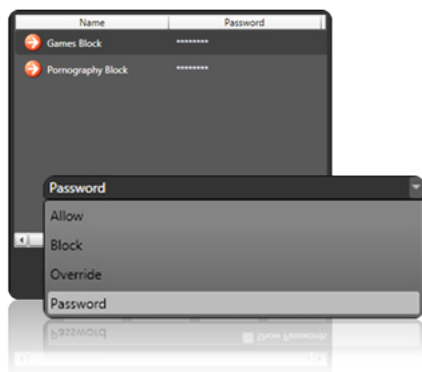

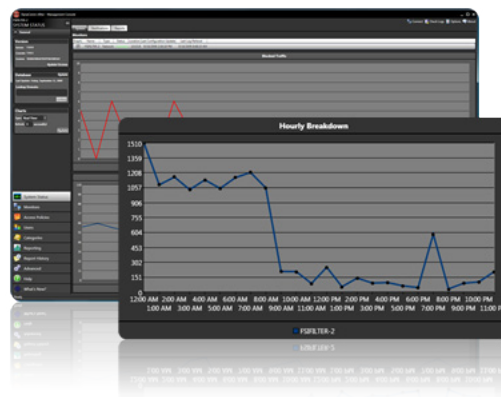

Preserve network bandwidth and use critical support resources more efficiently by preventing unnecessary Internet surfing along with resource-consuming file downloads and display.

### Insightful Reporting

Display, save, or send reports that provide views into the level of Internet traffic, where users are surfing, which protocols are used most often, and more. Reporting provides 50 predefined reports which can be used as-is or customized, and generated on demand or through a scheduled job.

### Advanced System Dashboard

DynaComm ifilter's new advanced system dashboard provides administrators a graphical look into their Internet and blocked traffic in real time. Furthermore administrators can look at historical traffic patterns with additional drill down capabilities. Need to take a look at system alerts or historical reports? No problem these too can be access from the system dashboard.

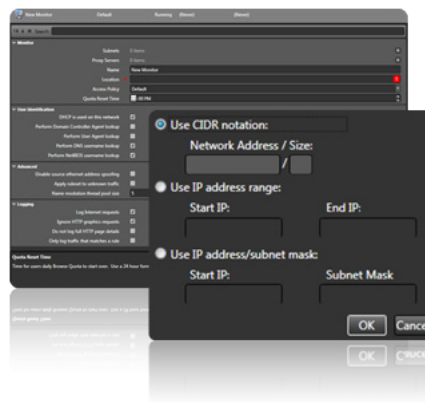

### Password Override Capabilities

Trying to access a site that you don't think should be blocked? Utilize our new password override feature. Create an Internet use policy that allows certain users or groups of users the ability to override blocked messages and continue with their work. This is a convenient way for Administrators and manager to access sites or download files from an end users workstation for maintenance and support purposes.

### Flexible deployment options

DynaComm ifilter can scale from 10 users to 10,000 and allows network administrators to flexibly manage, monitor and secure employee Internet access through several deployment methods. Choose between the traditional network monitor or enhance the functionality of Microsoft's ISA server with the ISA server monitor.

### About FutureSoft

Founded in 1982, FutureSoft is an international software company focused on developing information security and connectivity solutions. With offices in Houston, TX, US and in Cheshire, UK, the FutureSoft customers span the globe and include corporations of all sizes, government organizations and educational institutions seeking to manage and protect digital and business assets.
